MEMX — Infrastructure Engineering

Re: DevOps Engineer (2:00 PM – 11:00 PM ET) — Remote, US

Dear MEMX Hiring Team,

I am applying for the DevOps Engineer role on the 2:00 PM – 11:00 PM ET shift. Most candidates for a Linux platform role have operated Linux on someone else's cloud. I spent five years operating it **on our own hardware**.

- **Bare-metal Linux, five years.** Built Cloud.mn, Mongolia's first public cloud — OpenStack and KVM on our own hardware, 300+ enterprise clients. Operated the KVM hypervisor fleet with fully automated Ansible host builds, cutting manual provisioning time by 90%.
- **Production on-call at 99.95% uptime.** Hardware failure, host evacuation, capacity planning and live troubleshooting of a distributed system under load — the daily work, not the exception.
- **On-premises and cloud, both.** At Tech Partners, a multi-AZ AWS platform codified in Terraform; CI/CD across five products on GitLab CI and GitHub Actions, change failure rate down 30%; AWS spend down 40%.
- **Your tooling list.** Ansible, Terraform, Prometheus and Grafana in production. Python and shell automation by default. AWS Certified Solutions Architect – Professional.
- **Datacenter operations.** Launched the same platform at Transtelecom, Kazakhstan's largest datacenter, working directly with their DC team.

One note your posting asks for directly: I live in **Fairfield, Iowa**, outside your listed states, and would welcome your team's evaluation. The role is remote and I am **available to start September 28, 2026**.

I would like to talk about what your Linux estate actually looks like.

Sincerely,

Darkhanbayar Erdenebat
